

THE STARTER PROMPTS

8 jobs for Fable 5.

The most powerful AI ever built is free on your Claude plan until July 7. These are the 8 prompts worth running before the meter starts. Paste, swap the [brackets], let it run.

01

Money

02

Migrate

03

Clone

04

Overnight

05

Bugs

06

Back-test

07

Leads

08

Audit

Free until July 7. Then you pay by the word.

HOW TO USE · paste each prompt into Claude (Claude Code, Cowork, or the app) · swap the [brackets] for your project · let Fable 5 work

01

MONEY

Cancel dead subscriptions

Finds the money quietly leaking out of your accounts every month.

Break down my spending from the last 30 days into a table and a pie chart of everything I pay for. Flag every subscription I barely use, tell me exactly how to cancel each one, then walk me through it.

02

AUTONOMY

A two-month job in a day

Hand it a big migration or refactor and let it run unsupervised for hours.

Take on [the big migration or refactor]. Read the whole codebase and write a step by step plan with the risks. Then execute it end to end on your own: make the change, run the tests after every step, fix what breaks, and keep going until it is done and green. Do not stop unless you are truly blocked.

03

OWNERSHIP

Clone the apps you pay for

Rebuild a tool you rent every month as a local app you actually own.

Research how [app] works and write a plan to rebuild its core features as a local app on my machine. Then build it, test it, and keep going until the basics work end to end. Nothing should leave my machine.

04

BUILD

Ship an app overnight

Give it a goal at night, wake up to a working build instead of a to-do list.

Set a goal to build me [the app or game]. Keep building, testing and improving it on your own until it runs smooth and feels real. Commit as you go, work through the night, and have a working version by morning.

05

SHIP SAFE

Catch every bug before users do

A full pre-ship audit that surfaces the worst problems first.

Read this whole codebase and find real bugs, broken edge cases, and anything that falls over in front of a user. List everything by severity, flag anything that could leak user data, and fix nothing until I say go.

06

DECIDE

Stress-test a money hunch

Pull real data, back-test a theory, keep only the answer that survives.

I have a hunch: [your theory]. Prove it or destroy it. Pull the real data, back-test it across the full history, have your agents argue both sides, and give me only the answer that survives the argument.

07

GROWTH

Research and pitch 100 leads at once

A researcher agent on every prospect, a checker agent on every pitch.

```
Use [Clay / Apollo / Apify] to find [100] ideal customers for [your offer]. Put a researcher agent on each one: verified email, recent work, one real gap. Draft a three sentence pitch per person that offers one specific fix, and have a checker agent verify every claim before it reaches me.
```

08

META

Grade your whole AI setup

Scores the way you work and hands you a ranked cleanup list.

```
Read my skills, my memory, and our past sessions, then grade my whole setup. Send subagents through the transcripts and give me a scored report: what to fix now, what to merge, what to delete, and the one change that pays off most.
```

BEFORE JULY 7

Now go run them.

After July 7, Fable 5 moves to pay as you go: \$10 per million words in, \$50 out. A quick answer stays pennies, a long autonomous run starts to cost real money. Free is the window.
